

use garne final formula

Stage 2: Three-Factor Weighted Scoring

Each helper in `H_filtered[]` receives a Helper Effectiveness Score (HES) out of 100:

Formula:

$$\text{HES} = (w_{\text{resp}} \times S_{\text{resp}}) + (w_{\text{rep}} \times S_{\text{rep}}) + (w_{\text{exp}} \times S_{\text{exp}})$$

Where:

- $w_{\text{resp}} + w_{\text{rep}} + w_{\text{exp}} = 1.0$

For response score

$$S_{\text{resp}} = \alpha \times \text{Response_Time_Score} + \beta \times \text{Availability_Consistency_Score}$$

Where:

- $\alpha = 0.70$ (70% weight to response time)
- $\beta = 0.30$ (30% weight to availability consistency)
- $\alpha + \beta = 1.0$ (100% of the Responsiveness Score)

So the formula means:

$$S_{\text{resp}} = 0.70 \times \text{RT_Score} + 0.30 \times \text{AC_Score}$$

The Formula:

$$\text{RT_Score} = 1 - (\min(\text{avg_response_seconds}, 180) / 180)$$

Step 3: Calculate AC_Score

$$\begin{aligned} \text{AC_Score} &= \text{sessions_completed} / \text{sessions_accepted} \\ &= 10 / 12 \\ &= 0.8333 \end{aligned}$$

For experience score

Your Tier-Based Experience Score:

Junior (0-2 years):	0.70	(70% of max)
Mid-Level (2-5 years):	0.85	(85% of max)
Senior (5+ years):	1.00	(100% of max)
Expert (10+):	1.10	→ capped at 1.00

For reputation score (Trust Score)

Bayesian Average: The Solution

Bayesian Average adds "fake ratings" (the platform average) to pull new users toward the middle until they have enough real ratings.

The Formula:

$$S_{rep} = (avg_rating \times n + platform_avg \times m) / (n + m)$$

Final score 0-1 ko range ma aaucha * 100 gives the score used for ranking
